# FOREWORD

The 2009-2010 Household Income and Expenditure Survey (HIES) is the third household expenditure survey conducted in Papua New Guinea (PNG), and is the second HIES conducted by the National Statistical Office (NSO) of PNG. The previous survey, the Household Survey of PNG, was conducted in 1996 by Unisearch and the Institute of National Affairs. The first household expenditure survey (the 'HES') was conducted in 1975-1976 by the NSO. It remains the source of the expenditure weights of the Consumer Price Index.

The 2009-2010 PNG HIES involved close consultations with the representations from the Department of National Planning and Monitoring, Department of Treasury (DT), Bank of Papua New Guinea (BPNG), Department of Education, National Research Institute (NRI), University of Papua New Guinea (UPNG), National Department of Health (NDH), Department of Labour and Industrial Relations, the Independent Consumer and Competition Commission (ICCC) and other Development Partners.

The 2009-2010 HIES collected information on key topics such as family demography, education, health, employment and consumption. The scope of 2009-2010 HIES was broader than the previous survey, with more indicators and more households surveyed, including questions on living standards and other related subject areas. One key goal was to collect data on income and expenditure, and to enable a rebasing of the Consumer Price Index (CPI). This will assist future policy decisions and analysis to be better based on reliable evidence, such that they can better support improvements in the living standards of Papua New Guinea's people.

This report summarizes many of the key results of the survey, in areas ranging from educational attainment, health status, housing conditions, access to employment and the effects of disputes and crime. It summarizes these indicators by whether respondents are living in urban or rural areas, by region and, as appropriate, by age group and gender. Accompanying this collection of summary tables is a CD-ROM, containing the full survey data, the questionnaires, information on the areas surveyed and some of the material used to train the surveyors.

Alongside this set of summary indicators, the 2009/10 PNG HIES will also enable an assessment of living standards in PNG, a rebasing of the consumption basket underlying the PNG Consumer Price Index, and the construction of household consumption measures in the PNG National Accounts.

JOSEPH AKA  
NATIONAL STATISTICIAN

FRANCESCA DRAPULUVIK-TINABAR  
2009-2010 HIES DIRECTOR

# ACKNOWLEDGEMENTS

The 2009-2010 Household Income & Expenditure Survey (HIES) would not have been successfully completed without the input and support of individuals and various institutions. The survey was conducted by the Population and Social Statistics division (PSSD) of the National Statistical Office (NSO). The 2009-2010 HIES was jointly funded by the Government of Papua New Guinea (GoPNG), AusAID, the World Bank and UNICEF. Provision of Technical Assistance (TA) was from the World Bank, bringing together World Bank expert staff and International Consultants who provided technical assistance from planning stage to the reporting of findings.

I acknowledge with gratitude the initial support from the Department of National Planning and Monitoring Secretaries, Mr. Joseph Lelang and later Ms. Ruby Zarigga for the effort and support for funding for the 2009-10 HIES. I am indebted to Mr. Anthony Yauieb, Deputy Secretary, Economics and Financial Policy, Department of Treasury for the advice and the support he gave towards the funding of the project. Let me also thank all the Provincial Governments and Administrations for the full support in assisting the NSO to complete the survey.

The 2009-2010 PNG HIES required extensive resources, especially given the difficulties of conducting such a rich and robust a survey of PNG's disbursed population through challenging terrain and limited infrastructure. It was only possible through the significant funding from the Government of Papua New Guinea and its development partners, in particular AusAID, complemented by the resources of the World Bank and UNICEF.

My sincere gratitude is extended to the experts from the World Bank who provided technical assistance in the survey. I wish to thank Juan Munoz who provided advice on the sampling, and Valerie Evans, Victor Canales and Alvaro Canales who supported in the questionnaire design, development of field manuals, training of field personnel and other support in the course of the survey. Mr. Manohar Sharma must also be acknowledged for his support and time on the project and the assistance provided in putting together this set of Statistical tables. The HIES National Steering Committee (NSC) Members, the User's Advisory Committee (UAC) and the Financial Committee is not forgotten here for your contributions.

Let me extend my appreciation to the HIES Project Director, Ms. Francesca Drapuluvik-Tinabar for her overall advice and management of the project. The HIES Quality Assurance Team (QAT) who also made sure that data quality was maintained at all times must also be thanked for their inputs. Support for the project from the Population and Social Statistics Divisional Head, Mr. Alohai Pochapon must also be acknowledged.

I would like to thank the PSSD staff, the provincial staff and especially the Provincial Survey Coordinators (PSCs), all field personnel, data processing staff and household respondents who assisted at various levels to the successful completion of this survey. My sincere thanks to the tireless efforts of the Project Director Ms. Tinabar for overseeing the compilation of the Statistical Tables.

# GLOSSARY

<b>Adult</b>	Person aged 18 or older.
<b>Average Travel Time</b>	The average amount of time it takes to travel between the place of residence and the destination (school, health centre, work place, etc).
<b>Census Unit (CU)</b>	A statistical unit or area with its own identifiable physical boundary. It is the smallest geographical unit used in data collection for censuses and surveys in PNG, and so are the “building blocks” of all higher level geographical divisions.
<b>Computer Assisted Field Entry (CAFE)</b>	Computer application to enter and manage survey data in the field.
<b>Confidence Interval</b>	An estimated range of values which is likely to include an unknown population parameter, the estimated range being calculated from a given set of sample data.
<b>Construction Material</b>	The materials with which a building is made.
<b>Consumer Price Index</b>	A price index constructed by taking the weighted prices of a basket of commodities typically consumed by consumers.
<b>Data Entry Operator (DEO)</b>	Person responsible for entering raw data collected in the survey or census into computer flat form.
<b>Dwelling</b>	The building or structure in which a person or household lives.
<b>Educational Attainment</b>	The highest level of schooling completed.
<b>Elementary</b>	From school year ‘P’ through school year ‘2’.
<b>Female-headed Household</b>	A household headed by a woman.
<b>Financial Operations Committee (FOC)</b>	Committee responsible for the financial operations of the project.
<b>Gross Enrolment Rate</b>	The gross enrolment rate for a certain school level is the ratio of the number of students attending school at that specified level, irrespective of age, to the total number of children in the relevant school age group.

<b>Highlands</b>	Highlands is one of the four geographical regions of Papua New Guinea, and is comprised of the provinces of Southern Highlands, Enga, Western Highlands, Chimbu, and Eastern Highlands (at the time of the Survey, Hela and Jiwaka had not become separate provinces). These are located on the interior of PNG's mainland.
<b>Household</b>	A group of people living together, sharing resources and having common arrangements for cooking and eating.
<b>Household Head</b>	A person recognized by the members of a household as the head of that household who typically makes the major decisions on behalf of the household.
<b>Household Size</b>	Number of individuals who are members of a household and living together.
<b>Interviewer</b>	Person who asks questions and collects responses in survey interviews.
<b>Islands</b>	The Islands Region is one of the four geographical regions of Papua New Guinea, and is comprised of all the five islands Provinces, of Manus, New Ireland, East New Britain, West New
<b>Male-headed Household</b>	A household that is headed by a male member of the household.
<b>Marital Status</b>	Personal status of individuals in relation to the marriage laws or customs of PNG. Indicates whether a person is being never married, married, separated, divorced or widowed.
<b>Metro</b>	Metropolitan areas are larger urban areas, and include the areas within the municipal boundaries of Port Moresby and Lae.
<b>Momase</b>	Momase is one of the four geographical regions of Papua New Guinea, and is comprised of the provinces of Morobe, Madang, East Sepik and West Sepik. These are located on the northern part of PNG's mainland.
<b>National Steering Committee</b>	The Board at the national level that ensures that the agenda of the project (survey) is followed, and manages strategic and technical issues around the survey implementation.

<b>Net Enrolment Ratio</b>	<p>The net enrolment rate for a certain school level is the ratio of the number of students in the relevant school age group attending that level of education to the total number of children in the relevant school age group.</p> <p>While the denominators for the gross and net enrolment rates are the same, the numerator for the net enrolment rate is smaller as it excludes both under-age and over-age pupils for any given level of education.</p>
<b>Non-relative</b>	A person who is not related to the household head but is residing in the household at the time of the enumeration.
<b>Orphan</b>	Children that have lost one or both parents.
<b>Primary Sampling Unit</b>	A PSU or a cluster is the set of all housing units contained in a well defined geographic area. In the 2009-10 HIES, census units from the 2000 census are used as PSUs.
<b>Primary (Education)</b>	School Grade 3 through Grade 8.
<b>Provincial Survey Coordinator (PSC)</b>	Person appointed to coordinate a survey or a census within a Province.
<b>Quality Assurance Team (QAT)</b>	A team of experts responsible for ensuring that survey information is correctly elicited and recorded in data files.
<b>Reference period</b>	The period of time over which survey respondents are asked to report or recall a certain type of activity, behavior or events, with less frequent events generally recalled from a longer reference period.

<b>Relative</b>	A person who is associated and connected to another person birth or by marriage.
<b>Rural</b>	Rural areas are areas outside of urban centres, characterized by significant agricultural activity and often with greater reliance on subsistence agriculture rather than cash-based transactions.
<b>Sampling Frame</b>	The set of 2000 Census enumeration areas and its population structure is used sample PSUs and households for the 2009-2020 HIES.
<b>Sampling Weight</b>	Weight assigned to a sample unit to account for unequal probabilities of selection. The weight of a sampled unit is the reciprocal of its probability of selection into the sample and acts as the inflation factor to represent the number of units in the survey population that are represented by the sample unit to which the weight is assigned.
<b>Secondary (Education)</b>	School Grade 8 through Grade 12.
<b>Sex</b>	The gender of a person (male or female).
<b>Southern</b>	Southern is one of the four geographical regions of Papua New Guinea, and is comprised of the provinces of Western, Gulf, Central, Milne Bay and Northern Province. These are located in the southern parts of PNG's mainland. Geographically, Southern Region also includes the National Capital District that houses Port Moresby. However, for the purposes of this report, Southern region does not include NCD.
<b>Standard Error</b>	A statistical term that measures the accuracy with which a sample represents a population. It is computed as the standard deviation of the sampling distribution of a statistic.
<b>Strata (stratum)</b>	In the context of the HIES, a stratum is a geographical area within which an independent sample is collected.
<b>Supervisor</b>	A person in charge of supervising a team of interviewers and data entry operators.
<b>Tertiary (Education)</b>	Formal education in colleges or universities after completion of Grade 10 or 12.
<b>Urban</b>	Urban areas are areas of extended settlements forming towns and cities, characterized by extended areas of concentrated human dwellings and infrastructure development. Urban areas have a minimum population of 500 and a minimum population density of 195 persons per square kilometer.
<b>Users Advisory Committee</b>	Committee made up of the end users of the data or statistics generated by a survey.

# INTRODUCTION

The Statistical Tables presents key tabulations from the 2009-2010 Papua New Guinea Household Income and Expenditure Survey (2009-2010 PNG HIES). It uses the final cross-section sample of 4,191 households. The sample of households was selected from a nationally representative sample frame and a comprehensive set of multi-topic questionnaires was designed to elicit information on key topics such as family demography, education, health, employment, and consumption. The final dataset contains important information on the socioeconomic conditions of the population. This information will be crucial to informing policy in the country.

The main objective of this report is to highlight selected key results of the survey in a standard tabular format such that these can be quickly referenced by all stakeholders. The summary tables present various indicators at the national level, regional level, and with disaggregated by urban and rural areas. A copy of the full set of questionnaires and a fully labeled electronic copy of the 2009-2010 HIES dataset are published on the CD-ROM enclosed with this report.

## Background and objectives of the survey

---

The 2009-2010 HIES is the first comprehensive and nationally representative survey of the socio-economic status of PNG households since the 1996 Household Survey of PNG conducted by Unisearch from the University of Papua New Guinea (UPNG) and the Institute of National Affairs (INA). In 2008, the Government of Papua New Guinea began planning a Household Income and Expenditure Survey in urban areas with the primary objective to generate household consumption data that could be used to rebase the Consumer Price Index (CPI) which is currently based on a weighting diagram from a 1975-76 household expenditure survey.

While the updating of the CPI was an important objective, discussions between the government and development partners also noted that the prevailing situation presented an important opportunity to expand the scope of the survey, so that it could provide national (and not just urban) level data on important living standards indicators and behaviors that would be crucial to informing policy making in the country. Collection of such data had been long overdue as PNG had not had a national household survey for poverty monitoring and analysis since 1996. Recognizing this opportunity, the National Statistics Office of PNG agreed to expand the scope of the household survey to address the information gap in social statistics in PNG.

The 2009-2010 HIES database will now be an important public good available to all stakeholders both within and outside the government to monitor a wide range of development indicators as well as facilitate the formulation of informed macro and sectoral policies. Specifically, it will facilitate:

1. Development of a system of poverty monitoring and poverty mapping,
2. Better analyses of sectoral issues for development planning and formulation of poverty reduction policies in PNG,
3. Monitoring of human development indicators in the context of the Millennium Development Goals,
4. Updating the weighting diagram for the Consumer Price Index, and
5. More accurate estimation of the System of National Accounts.

## 2009-2010 HIES Questionnaires

---

As the 2009-2010 HIES was a multi-topic survey, planning and development of questionnaires involved close consultations with the HIES Users Advisory Committee (UAC) comprising of representatives from the Department of National Planning and Monitoring (DNPM), Department of Treasury (DoT), Bank of PNG (BPNG), National Research Institute (NRI), University of Papua New Guinea (UPNG), National Department of Health (NDOH), Department of Education (DoE), Department of Labour and Industrial Relations (DoLIR), the Independent Consumer and Competition Commission (ICCC), and several development partners. The following types of information were collected:

1. **Household level** information on housing characteristics, ownership of consumer durables, non-food consumption, access to various types of public services, and incidence and resolution of different types of disputes.
2. **Person-level** information on age, sex, education, health, employment status, receipt of remittances, and personal security. This was supplemented by anthropometric data for children aged six years or younger.
3. **Personal** record of all food and nonfood purchases for 14 consecutive days for all household members 15 years and older.

Information was collected using the following questionnaires that were initially piloted for fine tuning flow and content:

- a) Form A: Household Control Form
- b) Form B: Household Schedule Form
- c) Form C: Personal schedule
- d) Form D: Personal Diary
- e) Form E: Personal Notepad

This report summarizes information collected primarily in Forms A and B. Copies of the questionnaire are contained in the CD-ROM accompanying this publication):

## The 2009-2010 PNG HIES sample design

---

PNG is the largest nation in the South Pacific in both land area and population. It is comprised of around 600 islands, and the interior of the country is mountainous. Administratively, the country is divided into 22 provinces, within four geographic regions:

**Southern Region** comprising of the following provinces: Western, Gulf, Central, Milne Bay, Northern Oro, and the National Capital District

**Highlands Region** comprising of the following provinces: Southern Highlands, Enga, Western Highlands, Chimbu, Eastern Highlands, Hela, and Jiwaka

**Momase Region** comprising of the following provinces: Moroboe, Madang, East Sepik, and West Sepik

**Island Region** comprising of Manus, New Ireland, East New Britain, West New Britain, and the Autonomous Region of Bougainville.

A two-stage stratified cluster sample design was used in order to ensure independent estimates for the “rural”, “urban”, and “metro” areas of each of these regions. “Metro” denotes the two large urban centres of Port Moresby in Southern region and Lae in the Momase region. All the other urban areas in all regions were included in the “urban” stratum. The sample was thus divided into 10 strata (Table 1). Sample size in each cluster was set to ensure reliable strata-level representative estimates; in addition, the sample size in the metropolitan areas was set large enough to support the development of a new CPI expenditure basket. In each stratum, households were chosen in two stages. In the first stage, using the sampling frame of the 2000 Census, clusters (or Primary Sampling Units) (PSU) were chosen using probability proportional to size. A full listing of households was done in all chosen clusters and a pre-set number of households were then selected randomly from this list. In the non-metropolitan areas, 18 households were chosen per cluster whereas in the metropolitan areas, 6 households were chosen per PSU. The distribution of clusters and households across the 10 strata for the final sample is presented in Table I. Replacement census units or replacement households in each cluster are used in the case of emergencies<sup>1</sup> or when selected households could not be interviewed because of refusal, absence, illness in the family etc, were also selected using the same methodology.

**TABLE I. NUMBER OF CLUSTERS AND HOUSEHOLDS SELECTED FOR THE HIES**

Region	Metro		Urban		Rural		Total	
	Number of PSUs	Number of households	Number of PSUs	Number of households	Number of PSUs	Number of households	Number of PSUs	Number of households
Southern	108	652	13	238	23	410	144	1300
Highlands			12	215	47	842	59	1057
Momase	25	174	25	432	32	575	82	1181
Islands			12	212	23	441	35	653
TOTAL	133	826	62	1097	125	2268	320	4191

For the 2009-2010 HIES sample, the selection probabilities and raising factors are determined in accordance with the sample design described above. The probability of selecting a PSU<sub>ij</sub> in stratum *i* is

$$p_{ij} = m_i n_{ij} / n_i$$

where  $n_{ij}$  is the number of households in the PSU (as reported by the 2000 Census),  $n_i$  is the total number of households in the stratum (also as per the 2000 Census) and  $m_i$  is the number of clusters selected in the stratum.

The probability of selecting household *ijk* in PSU<sub>ij</sub> of stratum *i* (in non-metro areas) is

$$p_{ijk} = p_{ij} (18/n'_{ij})$$

where  $n'_{ij}$  is the number of households in the PSU, following the household listing operation. The raising factor or weight  $w_{ijk}$  for household *ijk* is the inverse of the selection probability  $p_{ijk}$ . Raising factors at the household- and person-level are provided in Table II.

<sup>1</sup> A number of Clusters in the country were designated “explicitly excluded stratum” due to their security and accessibility.

**TABLE II. HOUSEHOLD AND PERSON WEIGHTS BY STRATUM**

Region	Strata	Number of observations	Household weight	Average person weight
Southern	Metro	622	66.79	446.30
Southern	Urban	232	51.00	308.88
Southern	Rural	399	319.34	1776.77
Highlands	Urban	211	75.28	424.92
Highlands	Rural	841	470.25	2091.25
Momase	Metro	173	71.23	445.47
Momase	Urban	425	58.26	333.13
Momase	Rural	565	404.62	2274.49
Islands	Urban	210	46.55	288.15
Islands	Rural	403	311.87	1562.46

Noting the sample design above, whenever possible, tables in this report are provided in two formats:

1. The first group presents estimates at the national level, for rural and urban areas, and for each of the four regions.
2. The second set presents separate estimates for rural and urban areas within each of the four regions.

Finally, all information presented in this report is disaggregated by sex.

## Standard errors and confidence intervals

The statistics presented in this paper are based on a sample of the population and, for this reason, have sampling errors associated with them. For reasons of space, this publication does not report any standard errors or confidence intervals for the statistics. However, to illustrate the margin of error associated with the reported statistics, Table III shows the standard errors and 95% confidence intervals for payments of medicine (a table presented in Section 5, on Health indicators). In computing these standard errors and confidence intervals, the particular features of the 2009-2010 HIES sample design have been taken into account. As discussed above, the PNG-HIES is not a simple random sample of the population in PNG, but follows a stratified two-stage sampling design. Thus, the computation of standard errors and confidence intervals takes into account three key features of the survey design: strata, primary sampling units and sampling weights. These design features imply that the standard errors of PNG-HIES based statistics will be different to those that can be expected from a simple random sample.

## Survey organization

The planning and implementation of the survey was undertaken by the NSO and survey work was supported by Provincial Survey Coordinators (PSCs) of the 19 provinces and a team of technical advisors and consultants. A HIES Core Team was established at the NSO headquarter to administer the project and qualified field personnel were recruited and trained in field enumeration. A total of 20 field teams were formed each consisting of a Supervisor (Team Leader), 3 interviewers, and a Data Entry Operator. There were 6 teams in the Southern region, 5 teams in the Highlands region, 6 teams in Momase, and 3 in the Islands region. In all, the HIES team included 200 personnel, including the PSCs, security staff, drivers/boat operators, village councilors, translators, porters and others.

To ensure quality, each team carried a laptop, and computer-assisted field entry (CAFE) was performed concurrently in the field sites. CAFE enabled computer assisted data quality checks immediately, strengthened supervision, and provided the opportunity to revisit households in case rectification was needed. Further quality checks were performed by a designated Quality Assurance Team (QAT). Each month, completed questionnaires and soft copies (on flash drives) were sent to NSO headquarter for a final check by QAT and for storage.

The project was jointly funded by the Government of Papua New Guinea (GOPNG), the World Bank, AusAID, and UNICEF with GOPNG providing the bulk of the funding. The HIES National Steering Committee (NSC), the Financial Operations Committee (FOC), and the Users' Advisory Committee (UAC) were established to provide technical assistance and oversee the project implementation.

## Training and fieldwork

Because of the complexity of the survey, training was conducted for a full month (end of February-end of March 2009) to allow interviewers, supervisors, and data entry operators to master techniques and processes. (Some of the manuals provided to interviewers, supervisors, and data entry operators are included on the CD-ROM attached to this publication.) The training covered all aspects of survey operations including household listing, interviewing techniques, good understanding of all sections of the questionnaire, and data entry. After classroom tests and field practical tests, 100 qualified persons were

selected and allocated into 20 teams. Two additional training sessions and refreshers were conducted over the course of the survey for newly recruited team members.

Data collection was conducted simultaneously in all provinces from July 2009 to January 2011. The survey was initially planned to be spread over 12 consecutive months to account for seasonality. However, because of funding delays, it took almost 18 months for survey completion. Annex 1 (on the CD-ROM accompanying this publication) provides the final list of PSUs surveyed.

## **Future uses of the 2009-2010 HIES data**

---

Notwithstanding the large number of tabulations presented in it, *this report only scratches the surface of the wealth of information that 2009-2010 HIES contains*. It is hoped that the publication of these Summary Tables, along with the public release of the 2009-2010 HIES dataset and associated documentation, will spur the use of this dataset by policy makers, planners, social researches, students, and administrative officials and help in obtaining a clearer and better assessment of the lives of the people of PNG, and that this will ultimately lead to policies and actions that improve their quality of life.

## SECTION 1. DEMOGRAPHICS

This section describes selected characteristics of the population of PNG. The demographic profile includes the population structure by sex and age groups as well as the distribution of the population by marital status and household size. The prevalence of orphanhood is reported for all children under 15 years old. Orphans are defined as children that have lost one or both parents.

The 2009-2010 HIES captures the population living in private households. A household is a group of persons (or a single person) who usually live together and have a common arrangement for food, such as using a common kitchen or a common food budget. The persons may be related to each other or may be non-relatives.

## SECTION 2. EDUCATION

This section describes educational attainments of and various aspects of the use of educational services by the population above 6 years of age. A large number of topics are covered including the highest level of schooling attained, grade completion rates; reading and writing ability; elementary, primary and secondary enrolment rates; population that has never attended school and the reasons for non-attendance.

The highest level of educational attainment refers to the most advanced grade level completed in the educational system. Levels considered are Elementary (Elementary P and Elementary 2), Primary (Grade 3 to Grade 8), Secondary (Grade 9 to Grade 12), and Tertiary (beyond Secondary).

Reading and writing ability refers to the ability to read and/or write a letter in the language spoken in the household. Reading/writing ability is as self-reported by household members; no literacy tests were administered during the survey.

## 2. EDUCATION

Net and gross enrolment rates are calculated for the three main educational levels: elementary, primary, and secondary. The relevant age group for elementary is those aged 6 to 8 years, for primary those aged 9 to 14 years, and for secondary those aged 15 to 18 years. The gross enrolment rate for a certain level is the ratio of the number of students attending that level irrespective of their age to the total number of children in the relevant age group for that level. The net enrolment rate for a certain level, on the other hand, is the ratio of the number of students in the relevant age group attending that level to the total number of children in the relevant age group for that level. In other words, while the denominators for the gross and net enrolment rates are the same, the numerator for the net enrolment rate is smaller as it excludes both under-age and over-age pupils for any given level of education. Over-age students are the most important reason for net enrolment rates to be smaller than the gross rates, and they reflect the problems of late starters, repeaters, and others who have had some interruption in their educational progression.

All types of enrollment status reported are based on attendance in school reported by the survey respondents. Time to travel to school is also self-reported.

## SECTION 3. DWELLING

This section provides information on housing conditions in Papua New Guinea. The tabulations depict the type of existing dwellings, their main characteristics, the ownership status of the residence, availability of and access to utility services such as water, sewage, electricity, and cooking fuel, and ownership of phones.

Dwellings are differentiated by the type of construction materials of external walls, construction material of roof, and major construction material of the floor. They are also distinguished by the type of building: traditional/non-traditional, overall permanence of structure, and whether it is attached i.e. a flat or duplex.

All information on dwellings is reported by household respondents. All tables are further disaggregated by the sex of the household head.

## SECTION 4. OWNERSHIP OF DURABLE HOUSEHOLD GOODS

This section provides information on a variety of durable goods owned by the population.

Durable goods are restricted to those intended for household consumption, and not for business or production purposes. These consumer durables are expected to yield services and utility to the household over a number of years.

The durable goods covered by the survey mostly consist of household appliances such as stoves, refrigerators, microwave oven, washing machines, fans, television, audio and video equipment, camera radio, personal computer and mobile phones. They also include transportation and automotive equipment such as bicycle, motorcycle, car/truck/bus, and boats.

## SECTION 5. HEALTH

This section reports on the current status of both the population's health and aspects of the coverage and performance of the health system in the country. It presents tabulations on a wide range of indicators and outcomes including: the use of mosquito nets as a means of preventing malaria, self-reported incidence of malaria, self-reported morbidity rates (the proportion of the population reporting health complaints in the last 30 days), visits to a health care facility in the last month and purchases of medicines without prescription, hospitalizations in the last year, and self reported consumption of betelnuts, tobacco, and alcohol. Self-reported incidence of disability (unable to provide self-care as washing or dressing) is also provided.

It also reports prevalence of undernourishment among children 5 years old or younger. This is done by comparing children's weight and height with the average of weight and height of well-nourished children

of the same age. Following common practice, three anthropometric indices are used to compute prevalence based on weight and height measurements of children and their age. Low values of these indices indicate different aspects of child malnutrition. The three anthropometric indices are:

1. Height-for-age (H/A). This reflects achieved linear growth relative to age (how tall a child is relative to the average among children of that age). Low height-for-age, also called 'stunting', is indicative of long-term deficiencies in nutrition and/or poor health, for example poor micronutrient consumption and/or an inability to absorb micronutrients for health reasons.
2. Weight-for-age (W/A). Low weight-for-age, or being underweight, is an indicator of body mass relative to age, and is influenced by both sets of factors determining weight-for-height and height-for-age.
3. Weight-for-height (W/H). Low weight for height (ie, being excessively thin relative to height), also called 'wasting' is indicative of weight loss or insufficient weight gain relative to height, and may be the consequence of severe food deprivation or severe disease (in particular diarrhoea), but it can also be due to chronic conditions.

These anthropometric indices are calculated, first, by comparing the age, sex, weight and height of each child with those of a reference population set by the World Health Organization. The reference population – the group against with those being surveyed are compared – is the distribution of height and weight for children of given ages and sex in a well-nourished population, with the well-nourished population defined with reference to many different countries, including some with population and economic characteristics and cultural practices similar to Papua New Guinea.

Indices are calculated separately for each of the H/A, W/H and W/A indicator. These are expressed as z-scores, which are defined as the difference between the value of the indicator for an individual child from the median value for the reference population (for the corresponding gender and age), divided by the standard deviation for the reference population (for the corresponding gender and age).

$$z = \frac{\text{indicator}_i - \overline{\text{indicator}_{REF}}}{\text{st.dev}(\text{indicator}_{REF})}$$

Where:

$\text{indicator}_i$  is the value of the indicator for child  $i$ .

$\overline{\text{indicator}_{REF}}$  is the median value of the indicator in the reference population  $REF$

st.dev is the standard deviation.

Children who are more than two standard deviations below the reference population (z-score < -2) are considered undernourished (stunted, underweight or wasted), while those more than three standard deviations below the reference population (z-score < -3) are considered severely undernourished (severely stunted, severely wasted or severely underweight). The tabulations report the prevalence of child malnutrition in terms of the percentage of children 5 years of age or younger who are either undernourished or severely undernourished.

## SECTION 6. EMPLOYMENT

This section presents a number of indicators on employment conditions in Papua New Guinea. In the survey, employment-related questions were asked for all persons 15 years and older. The 7 days prior to the interview is used as the reference period. Those categorized as 'employed' comprises those working for wages, salaries, or for profit and/or growing food, catching fish, or making articles for own use or for sale. The category 'unemployed' comprises those that did not work in such ways and were looking for work, and excludes fulltime students, those having home duties, and those unable to work due to disabilities, bad health or age.

Employment was further classified into formal wage jobs, informal sector activities, casual labor, non-agricultural business, and agricultural business. Sectoral breakdown is available for each for these categories.

## SECTION 7. LOANS AND PRIVATE TRANSFERS

This section reports information on household financial transactions of households in two specific areas: remittances or receipts of cash or goods in kind from other households and individuals – whether living in the same vicinity or elsewhere – and loans, also both cash and in-kind, obtained from all private and public sources. The reference period for remittances is 12 months, while the reference period for loans is the last three months prior to the survey.

**TABLE 7.1 RECEIPT OF PRIVATE TRANSFERS IN CASH OR KIND BY RURAL AND URBAN AREAS, BY REGIONS, AND BY SEX**

## SECTION 8. DISPUTES

This section presents information collected on the occurrence and nature of disputes. Questions on disputes were asked to the head of the household or his/her spouse. Specific information was collected on six broad types of disputes: disputes over resources, family related disputes, financial disputes, criminal disputes, disputes related to development projects, and disputes related to government decision making. For each type of dispute, questions were asked about who the adversary was, and whether the dispute resulted in property damage, injury or death. Information was also collected on how help was sought to resolve the dispute and costs related to dispute resolution. All responses are self-reported and un-verified.

## 8. DISPUTES

**TABLE 8.1 INCIDENCE OF DISPUTES OF VARIOUS TYPES BY RURAL AND URBAN AREAS AND BY REGIONS**

(Percent of household heads or spouse reporting disputes)

	National	Rural	Urban	Metro	Southern	Highlands	Momase	Islands

## SECTION 9. PERSONAL SECURITY

This final section presents information on perceptions about personal security the population 15 years and older. In the survey, all persons 15 years of age and above were asked about their perception on how the level of crime had changed in their area in last 12 months prior to the survey, the most common crimes committed in the area, the types of crime they were most “afraid” of, and the types of activities that crime in their area stopped them from doing.

**TABLE 9.1 ASSESSMENT OF SECURITY ISSUES, BY RURAL AND URBAN AREAS, BY SEX AND BY AGE GROUPS**

(Percent of population 15 years or older)

	National	Rural	Urban	Male	Female	Age group			
						less than 31	31-39	40-59	60+
Perceived change in the level of crime at the time of the survey compared with 12 months previously									
More crime	28.8	28.1	29.9	27.0	29.8	29.2	26.5	27.5	32.7
Less crime	40.6	41.0	39.8	43.1	38.5	40.0	42.1	42.3	36.4
Stayed the same	24.6	23.4	25.9	24.4	23.2	23.5	24.8	23.9	21.4
